

Excerpt from Extra-Universal Mechanics And the Nature of Reality

I do agree that it is the collision of these membranes that causes the creation and sometimes destruction of universes.

If the collision of these membranes does create universes, it is likely that they contain large amounts of some kind of energy.

I would also like to suggest that membranes can not only collide, but can remain in contact with each other, overlapping and creating a new set of properties which will effect the nature of the universes created in that part of the multiverse.

Our multiverse is comprised of two or probably more membranes, upon which our universe is one among probably countless others. If the constant total number of spacial dimensions for any universe is eleven (three large and eight small, in our case), it is likely that this is not a constant in other multiverses.
